- 1. "UTF-8" is the character set to represent letters and symbols with ASCII value. There may be other character sets but we use utf-8 as it can represent most of the characters.
- 2. In <meta> tag we can use "name" attribute to display the description, viewport, keywords etc.. and specify the values in the "content" attribute.
- 3. <em> tag helps to emphasize the content and in default it displays in italic style. We an change this style by styling.((( But html is not meant for styling.)))
- 4. We can use "&It;" in place of "<" and "&gt;" in place of ">" to differentiate between the tag and text.
- 5. There are some reserved characters in html like copyright symbol(&copy). For more symbols "https://html.spec.whatwg.org/multipage/named-characters.html"
- 6. Non breaking space ( ) is used to in place of of normal space to stick the words together.
- 7.   -> 2 breaking spaces.
- 8.   -> 4 breaking spaces.
- 9. tag is used to print the content same as in HTML file.
- 10. <br >> line breaker.
- 11. <a> ---> Anchor tag --> used to specify the links of other websites and files.
  - Different attributes of <a> tag are:
    - href -> specifies the link (We can use mailto: "mail\_address" to open the mail by clicking on the link.)
    - target -> specifies in which tab the link is opened
      - ✓ \_blank --> Opens the linked document in a new window or tab
      - ✓ \_self --> Opens the linked document in the same frame as it was clicked (this is default)
      - ✓ \_parent --> Opens the linked document in the parent frame
      - ✓ \_top --> Opens the linked document in the full body of the window
      - √ framename --> Opens the linked document in the named iframe
    - download --> if user clicks on the link , download will start
    - A link is a url that navigates user to the required page and hyperlink is the link the user clicks on to navigate to other page.
